# ABSTRACT

Tablets are a type of dosage form used for pharmaceuticals. It consists of an excipient powder mix and the active ingredient compressed or compacted into a fixed dose. Effective tableting aids may include diluents, binders or granulating agents, glidants (fluid aids), and glidants. Acceleration of tablet disintegration in the gastrointestinal tract. Flavorings or sweeteners to improve the taste. Pharmaceutical formulation goals to be achieved during work include tablets with long release times and strong physical strength. A tablet contains the highest concentration of medicinal ingredients while maintaining a constant unit of content per tablet. Multiple daily doses of the drug are required to keep the drug concentration within the therapeutic range. Increase patient compliance and avoid excessive dosing intervals. Development of a stable and safe oral formulation containing a time-release anti-inflammatory drug that can control arthritis. To determine the optimal dissolution profile for the dosage form being developed. Formulations were determined by comparing the in vitro dissolution profile to that of the innovative product. The aim of this study was to develop a pharmaceutically similar, stable, cost-effective, and improved-quality extended-release tablet formulation of etodolac. Polymers such as HPMC, ethylcellulose, Carbopol 934, MCC, and magnesium stearate are used to formulate tablets and conduct in vitro drug release studies.

Keywords: Extended-Release Tablet, Etodolac, Polymers, In-Vitro Study.

# I. INTRODUCTION

A tablet is a dosage form used in pharmaceuticals. It is made up of a powdered mixture of active ingredients and excipients that is pressed or compressed into a solid dosage. To facilitate efficient tableting, excipients can include diluents, binders or granulating agents, glidants (flow aids), and lubricants: disintegrate to encourage tablet break-up in the digestive tract; sweeteners or flavours to improve taste; and pigments to make the tablets visually appealing [1].

A polymer coating is frequently used to make tablets smoother and easier to swallow, to manage the active ingredient's release rate, to make them more resistant to the environment (increasing their shelf life), or to improve their look. Drug products designed to reduce the frequency of dosing by modifying the rate of drug absorption have been available for many years. Early modified release products were often intramuscular/ subcutaneous injections of suspensions of insoluble drug complexes, e.g., procaine penicillin, protamine zinc insulin, insulin zinc suspensions or injections of the drug in oil, e.g., fluphenazine decanoate [2].

Advances in technology have resulted in novel oral modified- release dosage forms. Many terms are used to describe modified-release products including extended-release, prolonged-release, controlled-release, controlled-delivery, slow release and sustained-release. Delayed-release Products are modified-release, but they are not extended-release by definition. They entail the release of a discrete amount(s) of medicament after it has been administered. e.g., Enteric-coated products, have a lag time in which little or no absorption takes place [3].

While there are a variety of modified-release pharmaceuticals available as prescription and over-the- counter medications, only a small number have been proved to provide a therapeutic benefit. Rather for being designed for clinical benefit, several of the formulations appear to have been devised to extend patents or give a marketing advantage over conventional-release medications. Various prototype formulation trails were taken and assessed with various quality controls such as dissolving and assay to achieve these goals [4].

By comparing the in vitro dissolution profile to that of the innovator product, the recipe was determined. The goal of this study was to create a pharmaceutically similar, stable, cost-effective, and quality-improved Etodolac extended-release tablet formulation. To formulate a tablet employing polymers such as HPMC, Ethyl cellulose,

Carbopol 934, MCC, Magnesium Stearate, and others and to conduct an in vitro release research on the drug [5, 6].

# II. MATERIALS & METHODS

**Table no 01-** Materials used in the formulation of etodolac extended release tablet [7-10]

| Ingredient Names                | Functional / category        |  |  |
|---------------------------------|------------------------------|--|--|

### Methods

HPMC as a synthetic polymer, Carbopol 934 as a stabilizer and also water-soluble polymer, microcrystalline cellulose, Magnesium stearate, and Tale were used to make Etodolac prolong release tablets utilizing the Direct Compression technique. Except for magnesium stearate and tale, etodolac and other similar excipients are weighed properly. Prior to combining, all materials are mixed properly. After that, place all of the ingredients in a glass mortar and triturate until uniformly combined. Then talc and magnesium stearate were added to the mix. A tablet compression machine was used to compress the powder combination into a tablet with punches on a tablet machine and make tablet [11].

The release rate regulating polymer hydroxy propyl methylcellulose was used in varied ratios to manufacture etodolac matrix tablets using the direct compression method. Bulk density, tapped density, Car's index, Hauser's ratio, and angle of repose were all used to analyses the granules' flow qualities. FTIR, diameter, weight variation test, hardness, friability, disintegration test, in vitro drug release, release kinetics, and stability studies were used to access the tablet for drug polymer compatibility [12].

# III. MODELING & ANALYSIS PREFORMULATION STUDY

# Solubility

A qualitative determination of the solubility was made by adding solvent in small incremental amount to a test tube containing a fixed quantity of solute or vice versa affects each addition the system is vigorously shaken and observed visually. Etodolac & Solvent. Take a Dilution 1mg drug with 1 ml of particular solvent that is Primary Solution. Second one 1ml sample from Primary Solution with 10 ml dissolution medium (0.1 N HCl) that is observe solution after preparing solution. Record Absorbance of observe solution by UV Spectroscopy with a particular wavelength & Plot the graph & formed the bar graph of all observation [13].

# **Melting Point-**

Collect the one side-sealed capillary, Thiele tube, Liquid paraffin, Thread, burette stand, and Thermometer from the laboratory. Fill the API in the capillary & bind that to the thermometer for temperature reading. Deep that bind capillary & thermometer in thiele tube. Provide that heat to the tube with help of a gas burner & observed the melting point & note-down the reading [14].

# UV Analysis of Drug (API) Sample

# For Acidic Gastric Media -

Preparation of 0.1N HCL solution (Solvent) which is act as a gastric fluid. Preparation of 1000 PPM Solution (Stock Solution) for that 100mg drug (Well-dissolved small amt soluble solvent) with 100ml solvent. Preparation of 10 PPM Solution [1ml sample from 1000-ppm solution + 100 ml Stock solution]. Preparation of 1,2,4,6,8,10 PPM Solution [1ml sample form 10ppm solution + 10ml Solvent = 1ppm sample]. Observed the absorbance by UV Spectroscopy with specific wavelength & plot the graph [15]

# For The Basic Gastric Media-

Preparation of stock solution (7.4 Phosphate buffer) Weigh 8 gm of sodium chloride then add it to the sufficient amount of distilled water. After that weigh 1.44 gm disodium hydrogen phosphate and 0.24 gm potassium dihydrogen phosphate. Add it into the prepared sodium chloride solution then weigh 0.2 gm potassium chloride. Then dissolved all the weighed samples in a sufficient amount of distilled water. Finally, maintain the solution up to 1000 ml with distilled water and, adjust the pH, if necessary. Follow the other procedure for dilution as per the acidic media procedure. Observed the absorbance by UV Spectroscopy with a specific wavelength & plot the graph [16]

# **Evaluation Study -**

# Precompression study-

# The angle of Repose (Ø)

The frictional force in a loose powder or granules can be measured by the angle of repose. The angle of repose is defined as the maximum angle possible between the surface of a pile of the powder and horizontal plane [17]

# Tan Ø= H/r

Were,

Ø= angle of reposeis the height of the cone, R= radius of the base of the cone

Different ranges of flow ability in terms of angle of repose are given in the below table.

| The angle of Repose (θ) | Flow      |  |  |  |
|-------------------------|-----------|--|--|--|
| >25                     | Excellent |  |  |  |
| 25-30                   | Good      |  |  |  |
| 30-40                   | Passable  |  |  |  |
| <40                     | Very poor |  |  |  |

# Table No 03- The Specification of Angle of Repose

### Method-

A funnel was filled to the brim and the test sample was allowed to flow smoothly through the orifice under gravity. The cone formed on a graph sheet was taken to measure the area of the cone, thereby evaluating the flow ability of the granules. The height of the pile was also measured.

# Bulk Density & Tap Density -

Loose bulk density (LBD) and tapped bulk density (TBD) of dose form and the dosage form blends were determined using bulk density apparatus. The pure drug was passed through the #18 sieve to break the clumps if any. Accurately weighed 5 g of the drug or 25 g of polymers was placed in a 100 ml graduated measuring cylinder. The initial volume was observed. The cylinder was tapped initially 100 times from a distance of  $14 \pm 2$  mm. The tapped volume was measured to the nearest graduated unit. The tapping was repeated additional 100 times. Again, the tapped volume was measured to the nearest graduated unit. The same thing was done for

# International Research Journal of Modernization in Engineering Technology and Science (Peer-Reviewed, Open Access, Fully Refereed International Journal)

Volume:05/Issue:01/January-2023 Impact Factor- 6.752

www.irjmets.com

powder blends of the dosage form. The LBD and TBD were calculated in g per ml using the following [18, 19].

Bulk Density = weight of the powder/volume of the packing

# Tab Density = weight of the powder / tapped volume of the packing

# Hausner ratio-

The Hausner ratio of the powder was determined by the following equation.

# Hausner ratio = TBD / LBD

The lower Hausner ratio (<1.25) indicates better flow properties than higher ones (>1.25).

# Post-compression parameters study-

# Weight Variation & Content Uniformity-

The weight variation statistical quality control test is used to confirm uniformity of the dosage unit and therefore also to support product safety, identity and quality. In the production of food and beverages, checking the weight of packages provides fast confirmation that fills quantities meet legal requirements [20].

| IP/BP                             | USP             | Limit  |  |
|-----------------------------------|-----------------|--------|--|
| More than 80mg or less than 250mg | 130mg to 324mg  | ± 7.5% |  |
| 250mg or more                     | More than 324mg | ± 5%   |  |

 Table no 04 - Table contains the Specific limit of weight variation as per various regulatory

### Thickness-

Thickness of tablets indicates the strength to withstand compression force applied during manufacturing process. Thickness of tablets was measured by digital caliper [21].

# Hardness-

Test Hardness (diametric crushing strength) is the force required to break a tablet across the diameter. The hardness of a tablet is an indication of its strength. The tablets should be stable to mechanical stress during handling and transportation. The degree of hardness varies with the different manufacturers and with the different types of tablets. The hardness was tested using Monsanto tester. "Hardness factor", the average of the six determinations, was determined and reported. The force was measured in kilograms per centimeter square [22].

# Friability-

Test Friability is the loss of weight of tablet in the container/package, due to removal of fine particles from the surface. This in process quality control test is performed to ensure the ability of tablets to withstand the shocks during processing, handling, transportation, and shipment. Permitted friability limit is 1.0 %. Roche friabilator (Electrolab, Mumbai) was used to measure the friability of the tablets. Ten tablets were weighed collectively and placed in the chamber of the friabilator. In the friabilitor, the tablets were exposed to rolling, resulting free fall of tablets (6 inches) within the chamber of the friability. It was rotated at a rate of 25 rpm. After 100 rotations (4 minutes), the tablets were taken out from the friability and intact tablets were again weighed collectively [23]

# % Friability = W1 - W2 /W1 × 100

Where, W1 is weight of the tablet before the test & W2 is weight of the tablet after test.

# Disintegration study-

Complete decomposition is defined as a state where no residue, except for fragments of the tablet shell or undissolved tablet shell, remains on the display of the test apparatus or adheres to the bottom surface of the dish if the disc is used; if there is still another residue then it is soft mass without a core material. The mean disintegration time of tablets containing microcrystalline cellulose or dicalcium phosphate dihydrate was 37 min and 44 min, respectively. Tablets containing corn starch or sodium carboxy-methylcellulose break down very slowly and adhere firmly to the gastric mucosa. In the project, we have to do the disintegration test in two different gastric media i.e., acidic & basic media [24].

### Procedure-

# International Research Journal of Modernization in Engineering Technology and Science (Peer-Reviewed, Open Access, Fully Refereed International Journal)

Volume:05/Issue:01/January-2023 **Impact Factor- 6.752** 

www.irjmets.com

Prepare 1000 ml of both gastric fluids. For Acidic (0.1N HCl Solution) [8.5 ml of Concentrated HCL+ 1000 ml distilled water]. For Basic (7.4 pH Buffer solution) 8 gm sodium chloride + 1.44 gm disodium hydrogen phosphate + 0.24 gm potassium dihydrogen phosphate + 0.2 gm of potassium chloride + Distilled water (100 ml). Place both solutions in the disintegration flask, allow maintaining temperature (Body temp). Place the Tabletin the test tube in the disintegration apparatus then start the instrument & observed the disintegration time [25, 26].

# Drug content-

The five Tablets were weighed and empty to obtain powder equivalent to 150 mg of Etodolac. Dissolved in a suitable quantity of buffer, the solution was filtered and suitably diluted. Drug content was recorded by a using UV spectrophotometer at a specific wavelength [27]

# In vitro study-

# **Dissolution studies-**

In Vitro dissolution studies for all the prepared tablets and the marketed available tablets were carried out using the USP paddle method at 50 rpm in 900 ml of buffer solution 0.1N HCL as dissolution media, maintained at 37 + 0.5°. 5 ml of sample was withdrawn from the dissolution medium at the specified regular intervals, filtered through Whatman filter paper, and assayed spectrophotometric at 280nm. An equal volume of prewarmed (37° C) fresh medium was replaced with the dissolution medium after each sampling, to maintain the constant volume throughout the test. Then the cumulative percentage of drug release was calculated and represented graphically [28-30]

| Apparatus     | USP Apparatus II (Paddle) |
|---------------|---------------------------|
| Medium        | 0.1N HCL                  |

By find out average weight, Total weight, Upper & lower limit of Tablet the determination of weight variation of all batches has been done in that as per specification the **% weight variation** is acceptable. As per that view the all Formations is pass this test but from all formulations the formulation number **F4** have very low variation & Formulation number **F3** having high variation.

 Table No 12 - The table contains the formulations hardness.

Graph Number 04 - The graph contains the formulations hardness

**Formulations** 

The tablet's hardness should be less than 4 Kg/cm<sup>3</sup> in order to comply with USP standards. The formulation with the very least hardness, F2, and the formulation with the most hardness, F4, are both available. **Friability Test-**

Graph Number 05- The graph contains the Friability of different formulation

# International Research Journal of Modernization in Engineering Technology and Science (Peer-Reviewed, Open Access, Fully Refereed International Journal)

Volume:05/Issue:01/January-2023 Impact Factor- 6.752

www.irjmets.com

The friability of the tablet should be less than 1% in accordance with USP requirements. F5 is the formulation with the very lowest friability, and F2 is the formulation with the highest friability.

# **Disintegration Test-**

 Table No 13 - The Disintegration time of various formulations in Acidic Gastric Media-Stomach

| Formulations | Time of Disintegration of Tablet (min) for Acidic Gastric Media-Stomach |       |       |       |  |  |
|--------------|---|-------|-------|-------|--|--|
|              | C1  | C2    | C3    | Mean  |  |  |
| F1           | 21.18   | 21.56 | 20.2  | 20.98 |  |  |
| F2           | 29.03   | 29.44 | 28.59 | 29.02 |  |  |
| F3           | 22.56   | 21.55 | 20.59 | 21.57 |  |  |
| F4           | 22.26   | 22.56 | 22.48 | 22.43 |  |  |
| F5           | 20.56   | 20.56 | 20.46 | 20.53 |  |  |

**Table No 14-** The Disintegration time of various formulations in Basic Gastric Media- Intestine

| Formulations | Time of Disintegration of Tablet (min) for Basic Gastric Media- Intestine |       |       |       |  |  |
|--------------|---|-------|-------|-------|--|--|
|              | C1  | С2    | C3    | Mean  |  |  |
| F1           | 30.49   | 30.18 | 30.54 | 30.40 |  |  |
| F2           | 48.42   | 49.2  | 48.59 | 48.74 |  |  |
| F3           | 30.12   | 30.52 | 30.49 | 30.38 |  |  |
| F4           | 30.4  | 31.56 | 32.12 | 31.36 |  |  |
| F5           | 30.12   | 30.52 | 30.49 | 30.38 |  |  |

**Graph number 06-** The graphical representation of disintegration time of formulation in two different media The Determination of disintegration time take place as per standard method & instrument take place in that due to the extended release Tablet the method follow by two different medium have to done i.e., Acidic media & basic media form the Stomach & intestine respectively as per observation the Tablet disintegrate in acidic media in short duration & basic media in long duration

# **Drug Content-**

| Table No 15- The Drug content in formulation i | n per | rcentage |
|--|-------|----------|
|--|-------|----------|

| Formulations | Drug Content (%) |
|--------------|------------------|
| F1           | 94.83            |
| F2           | 93.64            |
| F3           | 95.45            |
| F4           | 94.56            |
| F5           | 98.63            |

Graph number 09 - The Comparative In-Vitro Study of Marketed & Optimizes Formulation

### V. **CONCLUSION**

The in-vitro comparative study of marketed formulation & Optimize Batch (Dissolution Study/ Drug release Study) has been performed for 6 hr. by USP II apparatus i.e., Paddle type of apparatus used in that at normal body temperature this test has been performed. At the end of study resulted that the optimized Formulation having constantly increase & highest (98.62 %) drug release capacity & traditional marked formulation number having drug release capacity (96.029 %). Hence according to graph analysis we can say that the optimized formulation as good as marked formulation.

### VI. **CONFLICTS OF INTEREST**

There are no conflicts of interest or disclosures regarding the manuscript.
